

A Discussion of Claudia Buch's Lecture on “Banks' Profitability”

Filippo De Marco
(Bocconi University)

Banks benefit from high-rates

Fed's high-rates era handed \$1tn windfall to US banks

Lenders charged more for loans but kept interest payments to savers down, FT analysis finds

US banks' stock returns and interest rates

Industry-Level Stock Returns and Interest Rate Changes (2009-2023)

- Banks' stock returns **increase** with rates

Why?

Because they keep deposit rates (expenses) low

Similar story in the euro-area (less so for time deposits)

But lots of differences across countries...

Proportion of interest rates passed on to customers (%)

Deposit betas between June 2022 and May 2023 for large banks

FINANCIAL TIMES

Source: S&P Global Ratings • *From Dec 2021, when Bank of England began raising rates; **From March 2022, when Fed began raising rates, to March 2023

What's happening

- In a way, this is part of the normal banking business model
- Banks know that depositors “need” deposits for transactions and as a form of liquid wealth
- The fact that (large) banks pay no interest on deposit suggests they have **market power** over “**sleepy**” depositors
 - These depositors may be financially unsophisticated
- But are all depositors so sleepy?

Competition from digital banking

- [Recent evidence](#) on US banks suggests the rise of a new banking model, due to technological advancements:
 1. **High-rate banks** operate primarily online and attract less sticky depositors.
 2. **Low-rate banks** operate large bank networks and retain relatively stickier (unsophisticated) depositors.
- Digital banking [make depositors more alert](#) allowing them to shift their deposits across bank accounts quickly

Rise of a different kind of banking model

Source: [Kundu et al \(2024\)](#)

Digital banking in Europe

- **Digital competition** allows banks to easily go cross-border, in the spirit of the Banking Union
- Example: BBVA (Spanish bank) offered 4% interest on checking account in Italy from Sep2023, **fully online**
 - Raised €1.3 billion and over 100.000 new clients in 2 months
- The “sleepiness” may depend on the **initial level of interest rates**: depositors notice a change from 0% to 4%!

Conclusions

- Banks benefit from high-rates because they have market power over “sleepy”, unsophisticated depositors
- Depositors may not be so sleepy after all, especially when the rates go up significantly and there are online offers
- **Digital technology** is a game changer: lower operational costs (branch network↓) allows to increase rates
- Implications for banking supervision:
 1. High-rate banks maintain profitability by taking on **more credit risk**.
 2. Digital technologies can **increase** the speed of bank runs!

Thank you!

- Banks' stock returns **increase** with rates
- Interestingly, this is the case only **after the Global Financial Crisis** (2009-2023), not before (in 1994-2007 **-4.34**)
- The initial level of rates matters too
